ABOUT THIS GUIDE

This guide gives specific information on how to operate and use the CLI management functions of the switch.

The guide is intended for use by network administrators who are responsible for operating and maintaining network equipment; consequently, it assumes a basic working knowledge of general switch functions, the Internet Protocol (IP), and Simple Network Management Protocol (SNMP).

REVISION HISTORY/ADDITIONAL DOCUMENTATION

REVISION HISTORY

Release Number: Initial release

ADDITIONAL DOCUMENTATION

This CLI Guide and related documents available on the Black Box web site apply to the LGB1152A Gigabit Managed Ethernet Switch.

To download documentation from the Web site:

1. Go to www.blackbox.com
2. Enter the part number (LGB1152A) in the search box.
3. Click on the product in the "Product Results" page.
4. Click on the "Support" tab on the product page, and select the document you wish to download.

If you have any trouble accessing the Black Box site to download the manual, you can contact our Technical Support at 877-877-2269 or info@blackbox.com.

CHAPTER 1: CLI MANAGEMENT

Follow these steps to connect to the network.

- Using a DB9 RS-232 to RJ-45 cable, connect a terminal or terminal emulator to the Gigabit Managed Ethernet Switch to access the command-line interface.
- Attach the RJ-45 serial port on the switch's front panel to connect to the switch for console configuration.
- Attach the other end of the DB9 cable to an ASCII terminal emulator or PC Com-1, 2 port. For example, a PC runs the Microsoft Windows HyperTerminal utility.
- At the "Com Port Properties" Menu, configure the parameters as below:

Baud rate: 115200

Stop bits: 1

Data bits: 8

Parity: N

Flow control: none

1.1 LOGIN

The command-line interface (CLI) is a text-based interface. Users can access the CLI through either a direct serial connection to the device or a Telnet session (Default IP address: 192.168.1.1). The default user name and password to log in to the Managed Switch are listed below:

Username: admin

Password: <none>

NOTE: <NONE> MEANS AN EMPTY STRING

See the screen below.

```
Username: admin
Password:
LGB1152A#
```

After you login successfully, the prompt will be: <sys_name># .

If you login as an administrator, you will have privileges for setting the Managed Switch.

If you login as a guest, the prompt will be: <sys_name>>. You will not be able to set the Managed Switch while logged in as a guest. Each CLI command has specific privileges.

CHAPTER 1: CLI MANAGEMENT

1.2 COMMANDS OF CLI

The CLI is divided into several modes. If a user has privileges to run a particular command, the user has to run the command in the correct mode. To see the commands of the mode, input "?" after the system prompt, then all commands will be listed in the screen. The command modes are listed next.

TABLE 1-1. COMMAND MODES

MODE	PROMPT	COMMAND FUNCTION IN THIS MODE
exec	<sys_name>#	Display current configuration, diagnostics, maintenance
config	<sys_name>(config)#	Configure features other than those below
Config-if	<sys_name>(config-interface)#	Configure ports
Config-if-vlan	<sys_name>(config-if-vlan)#	Configure static vlan
Config-line	<sys_name>(config-line)#	Line Configuration
Config-impc-profile	<sys_name>(config-impc-profile)#	IPMC Profile
Config-snmp-host	<sys_name>(config-snmp-host)#	SNMP Server Host
Config-stp-aggr	<sys_name>(config-stp-aggr)#	STP Aggregation
Config-dhcp-pool	<sys_name>(config-dhcp-pool)#	DHCP Pool Configuration
Config-rfc2544-profile	<sys_name>(config-rfc2544-profile)#	RFC2544 Profile

Commands reside in the corresponding mode and can run only in that mode. If a user wants to run a particular command, the user has to change to the appropriate mode. The command modes are organized as a tree, and users start in enable mode. The following table explains how to change from one mode to another.

TABLE 1-2. CHANGE BETWEEN COMMAND MODES

MODE	ENTER MODE	LEAVE MODE
exec	—	—
config	Configure terminal	exit
config-interface	Interface <port-type> <port-type-list>	exit
config-vlan	Interface vlan <vlan_list>	exit

CHAPTER 24: CLI COMMAND REFERENCES

This chapter introduces the CLI privilege level and command modes.

- The privilege level determines whether or not the user could run the particular commands
- If the user could run the particular command, then the user has to run the command in the correct mode.

24.1 PRIVILEGE LEVEL

Every command has a privilege level (0–15). Users can run a command if the session's privilege level is greater than or equal to the command's privilege level. The session's privilege level initially comes from the login account's privilege level, though it is possible to change the session's privilege level after logging in.

TABLE 24-1. PRIVILEGE LEVEL AND COMMANDS

PRIVILEGE LEVEL	TYPES OF COMMANDS AT THIS PRIVILEGE LEVEL
0	Display basic system information
13	Configure features except for login accounts, the authentication method sequence, multiple logins, and administrator and enable passwords
15	Configure login accounts, the authentication method sequence, multiple logins, and administrator and enable passwords

24.2 COMMAND MODES

The CLI is divided into several modes. If a user has enough privilege to run a particular command, the user has to run the command in the correct mode. The modes that are available depend on the session's privilege level.

Use the no form of this command to disable the DHCP relay information option. The option 82 circuit ID format as “[vlan_id][module_id] [port_no]”. The first four characters represent the VLAN ID, the fifth and sixth characters are the module ID(in standalone device it always equal 0, in stackable device it means switch ID), and the last two characters are the port number. For example, “00030108” means the DHCP message receive from VLAN ID 3, switch ID 1, port No 8. And the option 82 remote ID value is equal the switch MAC address.	15	GLOBAL_CONFIG

dot1x guest-vlan supplicant	The switch remembers if an EAPOL frame has been received on the port for the life-time of the port.
